Montana Water Supply Outlook

February 1, 1988

MAR 1 1988

Foreword

How Forecasts Are Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are terms reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

For More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

| STATE | ADDRESS |
|------------|---|
| Alaska | 201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687 |
| Arizona | 201 East Indianola, Suite 200, Phoenix, AZ 85012 |
| Colorado | 2490 West 26th Ave., Denver, CO 80211 |
| New Mexico | 517 Gold Ave. S.W., Room 3301, Albuquerque, NM 87102-3157 |
| Idaho | 304 North 8th Street, Room 345, Boise, ID 83702 |
| Montana | 10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715 |
| Nevada | 1201 Terminal Way, Room 219, Reno, NV 89502 |
| Oregon | 1220 Southwest 3rd Ave., Room 1640, Portland, OR 97204 |
| Utah | 4402 Federal Building, 125 South State Street, Salt Lake City, UT 84147 |
| Washington | 360 U.S. Court House, Spokane, WA 99201-1080 |
| Wyoming | Federal Building, 100 East "B" Street, Casper, WY 82601 |

In addition to state reports, a Water Supply Outlook for the Western United States is published by the Soil Conservation Service and National Weather Service monthly, January through May. Reports may be obtained from the Soil Conservation Service, West National Technical Center, 511 Northwest Broadway, Room 248, Portland, OR 97209.

GENERAL OUTLOOK

SUMMARY:

January mountain precipitation was a little better than previous months but was still below average in most areas. February 1 snowpacks vary from 50 to 70 percent of average statewide. The southwestern corner of the state generally has a little better snowpack percentage. The lowest areas are generally in the northern part of the state. Soils are drier than normal. Spring and summer streamflows are forecast to be well below average on all streams and rivers in the state. These forecasts are based on current snowpack and soil moisture levels and the assumption that precipitation for the next six months will be near average. Most irrigation reservoirs in the state have near to above average storage.

SNOWPACK:

There were some improvements in snowpack percentages this past month. Presently the amount of water stored in the snow varies from 50 to 70 percent of average across the state. Better areas are in portions of the Bitterroot and Upper Clark Fork west of the Divide and parts of the Jefferson, Madison and Little Bighorn east of the Divide. The area near Red Lodge is the lowest in the state with some snow courses reporting only 30 to 35 percent of average water content. Most drainages in the northern part of the state are in the 50 to 55 percent of average range.

PRECIPITATION:

Most mountain drainages received 80 to 90 percent of average precipitation in January. Mountain ranges in central and north-central Montana recorded above average increments while the Kootenai River drainage in northern Montana recorded only 60 percent of average. Areas south of Lolo Pass near the Idaho border and some areas in the Yellowstone River headwaters reported monthly amounts near average. The total precipitation received since October 1 varies from about 55 to 65 percent of average across major drainages in the state. Most valley precipitation stations west of the Divide are below normal. These stations are reported by the National Weather Service.

RESERVOIRS:

Storage in reservoirs is quite variable across the state. Most large multipurpose reservoirs west of the Divide have below average storage. East of the Divide, most multipurpose reservoirs have near or above average storage. Irrigation reservoirs west of the Divide generally have below average storage. Most irrigation reservoirs in the Missouri and Yellowstone drainages have near or above average storage with the exception of Lima Reservoir and some in central Montana.

STREAMFLOW:

Most streams are currently producing below average runoff as a result of the dry fall and low soil moisture. Forecasts of runoff for spring and summer months are below to well below average over the entire state. These forecasts are based on current snowpack, soil moisture and the assumption that subsequent precipitation will be near average. If moisture flow across the state does not improve, near record low flows could be recorded in some areas.

SOIL MOISTURE:

Deficient fall precipitation left soils dry going into the winter. There has been little snowmelt in the mountains since snowfall began accumulating in late November and soils remain dry under the snowpack. Some snowmelt water will be absorbed by the soil before runoff can begin.

WATER SUPPLY OUTLOOK:

Mountain precipitation in Montana drainages was below average again in January for the fifth consecutive month. The snowpack in both Montana and British Columbia watersheds is a little over one-half of average. Soils under the snowpack are drier than normal. Spring and summer runoff is forecast to be below average even if spring precipitation is near average.

For more information contact your local Soil Conservation Service office.

WATER SUPPLY OUTLOOK*

Mountain precipitation in January was better than previous months but is still below average. Snowpacks vary from 50 to 65 percent of average across the various Flathead tributaries. Soils under the snow remain drier than usual. Forecasts of spring and summer runoff are for below average even if spring precipitation is near average. If weather patterns continue to bring below average moisture, runoff could be one of the lowest on record.

For more information contact your local Soil Conservation Service office.

Monthly precipitation
Year to date precipitation

WATER SUPPLY OUTLOOK*

During January, mountain precipitation was similar to December or about 80 percent of average. Snow surveys still continue to report snowpack water contents 60 to 65 percent of that expected by February 1. Soils under the snow remain drier than normal. Based on current snow and soil moisture conditions and assuming near average precipitation for the next six months, spring and summer streamflows are forecast to be well below average. If the moisture situation does not improve, runoff could be near minimum of record.

Minimum —————

Current ●—●

Monthly precipitation

Year to date precipitation

WATER SUPPLY OUTLOOK:

Mountain precipitation during January was similar to December and about 85 percent of average. Water stored in the snowpack is still 30 to 40 percent below average. In the Bitterroot drainage, snowpack is only a little better than last year at this time. Tributaries below Missoula have less snow than a year ago. Forecasts of spring and summer runoff are well below average flows if precipitation is near average. If current weather patterns continue, streamflows could be lowest of record.

For more information contact your local Soil Conservation Service office.

Jefferson Basin

Mountain snowpack* (inches)

* Jefferson

Precipitation* (percent of normal)

*Based on selected stations

Maximum

Average

Minimum

Current

Monthly precipitation

Year to date precipitation

WATER SUPPLY OUTLOOK:

Mountain precipitation during January was about 85 percent of average. Water stored in the snowpack varies from 60 to 70 percent of average across the various drainages with the better areas near the Idaho border. Soils under the snow are still quite dry. Below average runoff is forecast for this spring and summer if precipitation over the next six months is near average. If precipitation patterns continue to produce less than average moisture, runoff could be quite low.

For more information contact your local Soil Conservation Service office.

Madison Basin

Mountain snowpack* (inches)

*Madison

Maximum Average

Minimum

Current Monthly precipitation

Year to date precipitation

Precipitation* (percent of normal)

*Based on selected stations

WATER SUPPLY OUTLOOK:

During January, mountain precipitation was a little below average over the drainage. More southern areas recorded a little above average amounts. Snowpack is about 70 percent of average above Hebgen Lake and a little less downstream. Soils under the snow are still drier than normal. Based on current snowpack and soil moisture levels and near average precipitation for the next six months, streamflow is forecast to be about 20 percent below average. Smaller tributaries below Hebgen will probably produce even less runoff.

For more information contact your local Soil Conservation Service office.

WATER SUPPLY OUTLOOK:

Mountain precipitation for January was about 70 percent of average in the St. Mary drainage and 130 percent of average in the Bear Paw Mountains. Currently, the snowpack is only about 50 percent of average in the St. Mary and Milk River headwaters and near Glacier National Park. The Bear Paw Mountains have a little better snowpack at about 70 percent of average. Spring and summer streamflow is forecast to be about 75 percent of average on the St. Mary River and its tributaries. The Milk River without the St. Mary Canal is forecast about 60 percent of average. These forecasts assume near average precipitation for the next six months.

For more information contact your local Soil Conservation Service office.

Precipitation* (percent of normal)

*Based on selected stations

Maximum ——— Average - - -
 Minimum ——— Current ● — ●

Monthly precipitation [Light Gray Box] Year to date precipitation [Solid Black Box]

WATER SUPPLY OUTLOOK

January mountain precipitation was about 85 percent of average over the Yellowstone River Basin above the Bighorn and a little above average in the Bighorn Mountains. Snowpacks are currently 55 to 60 percent of average in the Upper Yellowstone. Around Red Lodge, the snowpack is only 30 to 35 percent of average. The Bighorn Mountains have 65 to 75 percent of average snowpack while the Wind River Range is about 85 percent of average. Spring and summer streamflows are forecast 60 to 75 percent of average on the Yellowstone River and tributaries above Billings. The inflow to Cooney Reservoir is forecast to be about one-half of average. Streams flowing out of Wyoming are expected to produce 70 to 80 percent of average runoff.
